

KnurlTech

TECNOLOGÍA DE MOLETEADO

Amplia gama de herramientas de moleteado y de moletas, tanto por corte como por deformación, pensadas para realizar un moleteado perfecto trabajando en todo tipo de tornos.

KNURLING TECHNOLOGY

Wide range of knurling tools and knurling wheels, both for cut-knurling and form-knurling, for a perfect knurling operation on all types of lathes.

MOLETEADO POR DEFORMACIÓN / MOLETEADO POR CORTE

FORM KNUURLING / CUT-KNUURLING

1. Moleteado por deformación

Con este tipo de moleteado las estrías se generan por deformación del material, al ejercer las moletas presión sobre la pieza mientras gira. Este método no implica arranque de material por lo que no hay generación de virutas. Debido a la deformación del material se produce un incremento del diámetro de la pieza. El valor del incremento es variable, ya que depende del material de la pieza mecanizada y de la forma y paso de las estrías generadas (ver tabla página 8).

1. El moleteado por deformación es imperativo cuando se usa la técnica del moleteado radial (plongée).
2. Cuando el perfil a mecanizar es de forma RGV, RKE, RKV.
3. Cuando es necesario que el diámetro final de la pieza sea mayor que el diámetro de partida.
4. Cuando hay que realizar un moleteado en el fondo de una garganta.
5. Para realizar moleteados hasta una cara.
6. Para moletear en conos o caras frontales.

2. Moleteado por corte

En el moleteado por corte las estrías se generan por arranque de material. Este tipo de moleteado no genera sobreesfuerzos sobre la máquina y en muchos casos se obtiene un moleteado de mayor calidad y precisión.

Las herramientas utilizadas para esta técnica de moleteado llevan las moletas con un ángulo de inclinación de 30° respecto al eje de giro de la pieza. Esta inclinación hace que la moleta vaya cortando las estrías según gira y avanza a lo largo de la generatriz de la pieza.

El moleteado por corte no genera incremento del diámetro de la pieza mecanizada, ya que en teoría no hay deformación del material. Aunque cabe resaltar que la realidad es que siempre hay un leve desplazamiento del material, que si bien no es de la misma magnitud que el que se genera a por el moleteado por deformación, hay que tenerlo en cuenta cuando la pieza a realizar requiere de cierta precisión en el diámetro final.

Este sistema de moleteado no es aplicable en todos los casos. Solo los perfiles RAA, RBL, RBR y RGE se pueden ejecutar con las herramientas de moletear por corte.

1. El moleteado por corte posibilita la ejecución de piezas tubulares de paredes finas, imposibles de realizar mediante moleteado por deformación.
2. Cuando el material a moletear no es deformable como plásticos, nylon, hierro fundido.

1. Form knurling

In form knurling the teeth are generated by deformation of the material, because the knurls exert pressure on the piece while it turns. This method is made without removing material so no chips are produced. Due to deformation of the material the diameter of the piece is increased. The value of this increase is variable as it depends on the material of the piece machined and the form and pitch of the teeth generated (see table page 8).

1. Form knurling is imperative when a radial knurling technique (plongée) is used.
2. When the profile to machine is RGV, RKE, RKV.
3. When the final diameter of the piece needs to be bigger than the starting diameter.
4. When you have to make a knurling in the bottom of a throat.
5. To make knurling till a face.
6. To knurling in cones or front faces.

2. Cut-knurling

In cut-knurling the teeth are generated by removing material. This type of knurling does not generate overstrain on the machine and in many cases a higher quality and more accurate knurling is obtained.

The tools used for this knurling technique fit knurls with a 30° angle in relation to the rotation axis of the piece. Due to this inclination the knurls cut the teeth while they are turning along the piece.

The cut-knurling system does not generate an increase in the diameter of the machined piece as in theory the material is not deformed. Although it must be stated that there is always a slight displacement of the material that even though it is not of the same magnitude as that generated by form knurling, it must be taken into account when the piece to be made requires a certain precision in the final diameter.

This knurling system is not applicable in all cases. Only RAA, RBL, RBR and RGE profiles can be run with cut-knurling tools.

1. Cut-knurling makes it possible to execute thin walled tubular pieces, whereas with form knurling it is impossible.
2. When the material to be knurled is not deformable as plastics, nylon, cast iron.

TÉCNICAS DE MOLETEADO KNURLING TECHNIQUES

Básicamente existen dos técnicas de moleteado.

1. MOLETEADO CON AVANCE RADIAL (Tipo R)

El moleteado radial es aquel en el que la longitud del moleteado en la pieza coincide con el espesor de la moleta a utilizar, por lo tanto la herramienta de moletar solo hay que desplazarla radialmente (avance normalmente representado con la letra R○).

En esta técnica de moleteado no es necesario que la moleta vaya biselada, si bien siempre es mejor utilizar moletas biseladas para evitar una rotura prematura de las esquinas de los dientes. Los biseles confieren robustez a los cantos de las moletas.

Esa técnica de moleteado solo es utilizable con herramientas de moletar por deformación. Nunca con herramientas de moletar por corte.

There are basically two knurling techniques.

1. RADIAL FEED KNURLING (R type)

Radial knurling is one in which the length of the knurling in the piece coincides with the thickness of the knurl, therefore the knurling tool is to be moved radially (feed usually represented with the letter R○).

In this knurling technique it is not necessary to use beveled knurls, although it is always better so as to avoid premature breakage of the teeth angles. The bevels give strength to the edges of the knurls.

This knurling technique is only applicable to form knurling. It is never applicable to cut-knurling.

2. MOLETEADO CON AVANCE AXIAL (Tipo F)

El moleteado axial es aquel en el que la longitud del moleteado en la pieza es mayor que el espesor de la moleta a utilizar, por lo tanto la herramienta de moletar hay que desplazarla axialmente (avance normalmente representado con la letra F○) hasta alcanzar la longitud de moleteado total requerida.

Esta técnica de moleteado es utilizable tanto para las herramientas de moletar por deformación como las que trabajan por corte. En el caso de las herramientas de moletar por deformación, las moletas han de llevar biseles imperativamente. En el caso de las herramientas de moletar por corte las moletas no tienen que estar biseladas.

2. AXIAL FEED KNURLING (F type)

In axial knurling the length of knurling piece is longer than the thickness of the knurl, therefore the knurling tool has to move axially (feed usually represented with the letter F○).

This knurling technique is applicable to both form knurling tools and cut-knurling tools. In form knurling tools, the knurls must be beveled. In cut-knurling tools, the knurls must be unbeveled.

ELECCIÓN DE LA HERRAMIENTA DE MOLETEADO

CHOOSING THE MOST SUITABLE KNURLING TOOL

En muchos casos un mismo tipo de moleteado se puede realizar con diferentes tipos de herramientas. De presión de corte, de una o varias moletas.

En el siguiente cuadro detallamos para cada tipo de moleteado, con qué herramienta se puede realizar y de qué manera.

In many cases the same type of knurling can be made using different types of tools. Pressure knurling tools or cut-knurling tools of one knurl or more.

The following table shows which kind of tool can be used for each type of knurling.

Moleteados mecanizables con herramientas de deformación Allowed knurling for form knurling tools

| Tipo de moleteado Type of knurling | Herramienta Tool | Moleta Knurl | Avance radial Radial feed (R) | Avance axial Axial feed (F) |

* Valores aproximados / Approximate values

RELACIÓN ENTRE EL DIÁMETRO A MOLETEAR Y EL PASO

RELATIONSHIP BETWEEN PART DIAMETER AND PITCH

La relación entre el diámetro de la pieza a moletear y el paso de la moleta seleccionada es muy importante para poder lograr un moleteado de calidad. Siempre hay que tratar de conseguir que la longitud de la circunferencia de la pieza a moletear sea múltiplo del paso de la moleta utilizada.

EJEMPLO 1

Diámetro previo de la pieza: 21 mm

Paso de la moleta: 1.0 mm

Relación: $21 \times 3.1416 / 1.0 = 65.97$

Diferencia con número entero: $66 - 65.97 = 0.03$

Cuanta mayor diferencia haya entre el valor obtenido del cálculo anterior y un número entero, mayor esfuerzo tendrá que realizar el conjunto moleteador-moleta para tratar de compensar la desproporción. Ese sobreesfuerzo se traduce en un moleteado de peor calidad y una reducción en el rendimiento de la moleta.

En el peor de los casos, cuando el valor de esa proporción difiere demasiado de un valor entero, se produce "doble moleteado". En este supuesto, el conjunto moleteador-moleta no logra compensar la desproporción y durante las primeras la moleta hace múltiples penetraciones en la pieza sin respetar el paso.

EJEMPLO 2

Diámetro previo de la pieza: 18 mm

Paso de la moleta: 1.0 mm

Relación: $18 \times 3.1416 / 1.0 = 56.56$

Diferencia con número entero: $57 - 56.56 = 0.44$

EXAMPLE 1

Previous diameter of the workpiece: 21 mm

Pitch of the knurl: 1.0 mm

Ratio: $21 \times 3.1416 / 1.0 = 65.97$

Difference with whole number: $66 - 65.97 = 0.03$

The greater the difference between the value obtained from the above calculation and a whole number, the more effort the tool will have to do to try to compensate the disproportion. This over-pressure generates a reduction in the quality of the knurling and in the performance of the knurl.

In the worst case, when the value of this proportion differs too much of a whole value, it makes a "double knurling". In this case, the knurling-knurl set cannot compensate for the disproportion and during the first turns the knurl makes multiple penetrations into the part without respecting the pitch.

EXAMPLE 2

Previous diameter of the workpiece: 18 mm

Pitch of the knurl: 1.0 mm

Ratio: $18 \times 3.1416 / 1.0 = 56.56$

Difference with whole number: $57 - 56.56 = 0.44$

MOLETEADORES POR DEFORMACIÓN FORM-KNURLING TOOLS

M3

Características

- Recomendado para moleteados tipo RGE
- Ajuste y centrado de las moletas sobre la pieza mediante husillo roscado
- Doble posición de los brazos para mayor capacidad de trabajo (Fig. 1)
- Menor riesgo de flexión de la pieza al no ejercer presión radial
- Apta para trabajos no repetitivos
- Ejes de HSS fijados mediante circlip

Tipos de máquinas

- Para tornos convencionales

(Fig. 1)

Features

- Recommended for RGE type knurling
- Knurls self-centering by threaded spindle
- Double position of the arms for higher working capacity (Fig. 1)
- Lower risk of bending the workpiece as tool does not make radial pressure
- Suitable for non-repetitive works
- HSS pins fixed by circlip

Machine Types

- For conventional lathes

MOLETEADORES POR DEFORMACIÓN

FORM-KNURLING TOOLS

M8

Características

- Recomendado para moleteados tipo RAA
- Eje de metal duro
- Superficie endurecida para una mayor resistencia al desgaste
- Ajuste del ángulo de ataque mediante tornillos integrados en el mango

Features

- Recommended for RAA type knurling
- Carbide pin
- Anti-wearing treatment of the tool surface
- Adjustment of tool clearance angle by threaded studs integrated in the shank

MOLETEADORES POR DEFORMACIÓN FORM-KNURLING TOOLS

M20

Características

- Recomendado para moleteados tipo RAA
- Para moleteados hasta una cara lateral (Fig.1)
- Eje de HSS
- Superficie endurecida para una mayor resistencia al desgaste
- Ajuste del ángulo de ataque mediante tornillos integrados en el mango

(Fig. 1)

Features

- Recommended for RAA type knurling
- For knurling up to a shoulder (Fig.1)
- HSS bushing
- Anti-wearing treatment of the tool surface
- Adjustment of tool clearance angle by threaded studs integrated in the shank

MOLETEADORES POR DEFORMACIÓN FORM-KNURLING TOOLS

M10

Características

- Recomendado para moleteados tipo RAA
- Para moleteados hasta una cara lateral (Fig. 1)
- Eje de HSS
- Para trabajar a derechas o izquierdas (Fig. 2)
- Superficie endurecida para una mayor resistencia al desgaste
- Ajuste del ángulo de ataque mediante tornillos integrados en el mango
- Provista de arandela de HSS para prevenir el desgaste de la herramienta

(Fig. 1)

(Fig. 2)

Features

- Recommended for RAA type knurling
- For knurling up to a shoulder (Fig. 1)
- HSS bushing
- Able to fit on right-hand or left-hand (Fig. 2)
- Anti-wearing treatment of the tool surface
- Adjustment of tool clearance angle by threaded studs integrated in the shank
- Supplied with a HSS hardened washer to prevent tool wearing

MOLETEADORES POR DEFORMACIÓN FORM-KNURLING TOOLS

M12

Características

- Recomendado para moleteados tipo RGE en piezas de pequeño diámetro
- Menor riesgo de flexión de la pieza al no ejercer presión radial
- Sistema de centrado para compensar un posible desalineamiento del tornillo [Fig. 2]
- Ajuste y centrado de las moletas sobre la pieza mediante husillo roscado [Fig. 1]
- Ejes de metal duro
- Superficie de los brazos endurecida para una mayor resistencia al desgaste
- Ajuste del ángulo de ataque mediante tornillos integrados en el mango

Features

- Recommended for RGE type knurling on small diameter workpieces
- Lower risk of bending the workpiece as tool does not make radial pressure
- Self-centering system to compensate a possible misalignment of the lathe turret [Fig. 2]
- Knurls self-centering by threaded spindle [Fig. 1]
- Carbide pins
- Anti-wearing treatment of the arms surface.
- Adjustment of tool clearance angle by threaded studs integrated in the shank

MOLETEADORES POR DEFORMACIÓN FORM-KNURLING TOOLS

M9

Características

- Recomendado para moleteados tipo RGE
- Cabeza basculante para el autocentrado de las moletas sobre la pieza (Fig. 1)
- Cabeza reversible para trabajar a derechas o izquierdas (Fig. 2)
- Ejes de metal duro
- Superficie endurecida para una mayor resistencia al desgaste
- Ajuste del ángulo de ataque mediante tornillos integrados en el mango

(Fig. 1)

(Fig. 2)

Features

- Recommended for RGE type knurling
- Pivoting head for knurls self-centering (Fig. 1)
- Tool with reversible head able to fit on left-hand or right-hand lathes (Fig. 2)
- Carbide pins
- Anti-wearing treatment surface
- Adjustment of tool clearance angle by threaded studs integrated in the shank

MOLETEADORES POR DEFORMACIÓN FORM-KNURLING TOOLS

M21

Características

- Recomendado para moleteados tipo RGE
- Para moleteados hasta una cara lateral (Fig. 1)
- Eje de HSS
- Superficie endurecida para una mayor resistencia al desgaste
- Ajuste del ángulo de ataque mediante tornillos integrados en el mango
- Provista de arandela de HSS para prevenir el desgaste de la herramienta

(Fig. 1)

Features

- Recommended for RGE type knurling
- For knurling up to a shoulder (Fig. 1)
- HSS bushing
- Anti-wearing treatment of the tool surface
- Adjustment of tool clearance angle by threaded studs integrated in the shank
- Supplied with a HSS hardened washer to prevent tool wearing

MOLETEADORES POR DEFORMACIÓN FORM-KNURLING TOOLS

M16

Características

- Recomendado para moleteados tipo RKAA
- Especial para moleteado seg n DIN-72783
- Menor riesgo de flexi n de la pieza al no ejercer presi n radial
- Sistema de centrado para compensar un posible desalineamiento del torno (Fig. 1)
- Ajuste y centrado de las moletas sobre la pieza mediante husillo roscado (Fig. 2)
- Ejes de metal duro
- Provista de arandelas de HSS para evitar el desgaste de los brazos portamoletas

Features

- Recommended for RKAA type knurling
- Specially designed for knurling according to DIN-72783
- Lower risk of bending the workpiece as tool does not make radial pressure
- Self-centering system to compensate a possible misalignment of the lathe turret (Fig. 1)
- Knurls self-centering by threaded spindle (Fig. 2)
- Carbide pins
- Supplied with HSS hardened washers to prevent arms wearing

MOLETEADORES POR DEFORMACIÓN FORM-KNURLING TOOLS

M22-A

Características

- Recomendado para moleteados tipo RGE en piezas de pequeño diámetro
- Menor riesgo de flexión de la pieza al no ejercer presión radial
- Sistema de centrado para compensar un posible desalineamiento del tornillo (Fig. 1)
- Ajuste y centrado de las moletas sobre la pieza mediante husillo roscado (Fig. 2)
- Ejes de metal duro
- Superficie de los brazos endurecida para una mayor resistencia al desgaste
- Invertir la posición de los brazos según el Ø de la pieza a moletear (Fig.3)

Features

- Recommended for RGE type knurling on small diameter workpieces
- Lower risk of bending the workpiece as tool does not make radial pressure
- Self-centering system to compensate a possible misalignment of the lathe turret (Fig. 1)
- Knurls self-centering by threaded spindle (Fig. 2)
- Carbide pins
- Anti-wearing treatment of the arms surface
- The position of the arms must be reversed depending on the Ø to be knurled (Fig. 3)

MOLETEADORES POR DEFORMACIÓN FORM-KNURLING TOOLS

M17 10 / M17 20

Características

- Recomendado para moleteados tipo RAA y RGE
- Ataque frontal mediante 3 garras de ajuste simultáneo (Fig. 1)
- Sistema de centrado para compensar un posible desalineamiento del torno (Fig. 2)
- Ejes de metal duro
- Superficie endurecida para una mayor resistencia al desgaste

Features

- Recommended for RAA and RGE type knurling
- Frontal feeding by means of 3 jaws simultaneously adjusted (Fig. 1)
- Self-centering system to compensate a possible misalignment of the lathe turret (Fig. 2)
- Carbide pins
- Anti-wearing treatment of the tool surface

MOLETEADORES POR DEFORMACIÓN FORM-KNURLING TOOLS

M17 15 / M17 25

Características

- Recomendado para moleteados tipo RAA y RGE
- Ataque frontal mediante 3 garras de ajuste simultaneo (Fig. 1)
- Sistema de centrado para compensar un posible desalineamiento del torno (Fig. 2)
- Ejes de metal duro
- Superficie endurecida para una mayor resistencia al desgaste
- Para moleteados hasta una cara lateral (Fig.3)

Features

- Recommended for RAA and RGE type knurling
- Frontal feeding by means of 3 jaws simultaneously adjusted (Fig. 1)
- Self - centering system to compensate a misalignment of the lathe turret (Fig. 2)
- Carbide pins
- Anti-wearing treatment of the tool surface
- For knurling up to a shoulder (Fig.3)

MOLETEADORES POR CORTE CUT-KNURLING TOOLS

MFS 89

(Fig. 1)

Características

- Recomendado para moleteados tipo RAA
- Cabeza basculante para el alineamiento de la moleta (Fig. 1)
- Eje de HSS
- Ajuste del ángulo de ataque mediante tornillos integrados en el mango

Features

- Recommended for RAA type knurling
- Pivoting head for knurl alignment (Fig. 1)
- HSS bushing
- Adjustment of tool clearance angle by threaded studs integrated in the shank

MOLETEADORES POR CORTE CUT-KNURLING TOOLS

MFS 32

Características

- Recomendado para moleteados tipo RAA
- Giro de la cabeza portamoletas mediante tornillo sin fin, para un alineamiento preciso de la moleta [Fig. 1]
- Cuerpo reversible para trabajar a derechas o a izquierdas [Fig. 2]
- Mínimo voladizo entre el amarre y el extremo de la moleta [Fig. 3]
- Máxima rigidez para garantizar una calidad excelente de moleteado.
- Posibilidad de moletear cualquier helicé entre 0°-30° [Fig. 4]

Features

- Recommended for RAA knurling
- Pivoting head by endless screw, for a precise knurl alignment (Fig. 1)
- Reversible body for righthand or lefthand tool version (Fig. 2)
- Minimum tool overhang (Fig. 3)
- Maximum rigidity to guarantee an excellent knurling quality.
- Possibility of knurling any helix between 0°-30° (Fig. 4)

MF 14

Características

- Recomendado para moleteados tipo RGE
- Ajuste de las moletas seg n di metro a moletear mediante escala graduada (Fig. 2)
- Cabeza basculante para el alineamiento de las moletas (Fig. 1)
- Ejes de HSS+TIN
- Ajuste del ngulo de ataque mediante tornillos integrados en el mango

(Fig. 1)

(Fig. 2)

Features

- Recommended for RGE type knurling
- Easy setting to the workpiece diameter by means of a graduated scale [Fig. 2]
- Pivoting head for knurls self-centering [Fig. 1]
- HSS+TIN bushing
- Adjustment of tool clearance angle by threaded studs integrated in the shank

MOLETEADORES POR CORTE CUT-KNURLING TOOLS

MF 21

Características

- Recomendado para moleteados tipo RGE
- Ajuste de las moletas seg n di metro a moletear mediante escala graduada [Fig. 2]
- Cabeza ajustable en altura para el alineamiento de las moletas [Fig. 1]
- Cabeza reversible para trabajar a derechas o izquierdas [Fig. 3]
- Ejes de HSS+TIN
- Ajuste del ngulo de ataque mediante tornillos integrados en el mango

Features

- Recommended for RGE type knurling
- Easy setting to the workpiece diameter by means of a graduated scale [Fig. 2]
- Up & down tool head alignment for knurls centering [Fig. 1]
- Tool with reversible head able to fit on left-hand or right-hand lathes [Fig. 3]
- HSS+TIN bushing
- Adjustment of tool clearance angle by threaded studs integrated in the shank

MOLETEADORES POR CORTE CUT-KNURLING TOOLS

MF 42

Características

- Recomendado para moleteados tipo RGE
- Ajuste de las moletas seg n di metro a moletear mediante escala graduada [Fig. 3]
- Cabeza ajustable en altura para el alineamiento de las moletas [Fig. 1]
- Cabeza reversible para trabajar a derechas o izquierdas [Fig. 2]
- Ejes de metal duro

Features

- Recommended for RGE type knurling
- Easy setting to the workpiece diameter by means of a graduated scale (Fig. 3)
- Up&down tool head alignment for knurls centering (Fig. 1)
- Tool with reversible head able to fit on left-hand or right-hand lathes (Fig. 2)
- Carbide pins

(Fig. 1)

KIT DE MOLETEADORES KNURLING KITS

KIT MOLETEADORES KNURLING KITS

Características

- Kit de moleteado compuesto por una herramienta doble para moleteados cruzados tipo RGE y una herramienta simple para moleteados rectos tipo RAA
- Varios tamaños disponibles
- Suministrado en una estuche de protección de PVD rígido
- Incluye llaves de servicio
- No incluye moletas

Features

- Cut knurling kit consisting of a double tool for cross-knurling type RGE and a single tool for straight knurling type RAA
- Available in various sizes
- Supplied in a rigid PVD protection case
- Service keys included
- Knurls not included
